

CLAIMS

What is claimed is

1. (Currently Amended) A connector for packings containing medical liquids, particularly infusion, transfusion or enteral bags, comprising
 - a connecting part (1) with a passage (2) for accommodating a spike for withdrawal of the liquid which can accommodate a rod or a spike for filling or withdrawal of liquid.
 - a closure part (3) which can be fitted onto the connecting part (1) and closes the passage (2) in the connecting part,
characterized in that the connecting part (1) has an elastically deformable pinching-off part (4), which re-assumes its original shape again after pinching with a pinching device and is designed as a tubular portion with a noncircular cross section, and in that the pinching-off part (4) merges into a base part (5) which widens to both sides and which can be integrated in the packing.
2. (Original) The connector as claimed in claim 1, characterized in that the closure part (3) and the connecting part (1) are secured with a snap fit.
3. (Original) The connector as claimed in claim 1 or 2, characterized in that a self-sealing membrane (11) is arranged between the connecting part (1) and the closure part (3) and can be pierced by the spike for withdrawal of the liquid.
4. (Original) The connector as claimed in claim 3, characterized in that the self-sealing membrane (11) is held clamped with elastic deformation between the connecting part (1) and the closure part (3).
5. (Previously Presented) The connector as claimed in claim 1, characterized in that the closure part (3) has a cap-shaped bottom part (6) which is adjoined, via an annular break zone (7), by a top part (8) that can be broken off.
6. (Original) The connector as claimed in claim 5, characterized in that the top part (8) that can be broken off is designed as a flat grip piece.
7. (Original) The connector as claimed in claim 6, characterized in that the cap-shaped bottom part (6) and/or the flat grip piece (8) is identified by an arrow (17, 18) indicating the direction of flow.
8. (Original) The connector as claimed in claim 7, characterized in that the arrow (17, 18) is designed as a recess and/or as a raised structure.

9. (Previously Presented) The connector as claimed in claim 1, characterized in that the base part (5) is designed in the shape of a boat.

10. (Previously Presented) A packing for medical liquids, particularly an infusion, transfusion or enteral bag, having at least one connector as claimed in claim 1.
